

AI1110 : Probability And Random Variables

Assignment 1

Soham Rajesh Pawar
CS22BTECH11055

Question :

12.13.1.7 : Two coins are tossed once, where

- 1) E : Tail appears on one coin, F : One coin shows head.
- 2) E : No tail appears, F : No head appears.

Answers :

- 1) (i) $\frac{2}{3}$
- 2) (ii) 0

Solutions :

Sample Space :

HH, HT, TH, TT

Where,

- 1) H - Heads
- 2) T - Tails

Formulae :

$$P(E|F) = \frac{P(E \cap F)}{P(F)} \quad (1)$$

Part 1 :

From the sample space, We can see that the probability of the concerned events is :

- 1) $P(E \cap F)$ i.e P(Tail appears on one coin and One coin shows head) : $\frac{2}{4}$
- 2) $P(F)$ i.e P(One coin shows head) : $\frac{3}{4}$

Plugging the values in Equation 1 :

$$P(E|F) = \frac{2}{3}$$

Part 2 :

From the sample space, We can see that the probability of the concerned events is :

- 1) $P(E \cap F)$ i.e P(No tail appears and No head appears) : 0
- 2) $P(F)$ i.e P(No head appears) : $\frac{1}{4}$

Plugging the values in Equation 1 :

$$P(E|F) = 0$$
